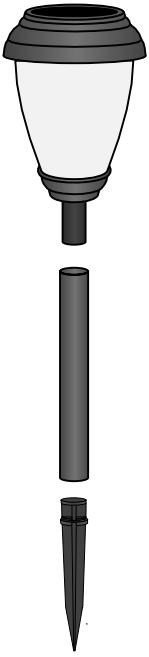
Charleston Solar Path Light

First Use

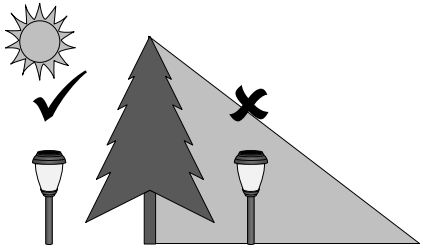
The Try Me switch can be used to help match the LED color to the lantern color, afterwards it can be disconnected and discarded. Although there may be some charge left in the battery we recommend fully charging it before first use. Leave the switch in the off position for 2 sunny days to ensure the battery is fully charged. Once fully charged switch to ON and the lights will automatically illuminate when it gets dark.

Assembly

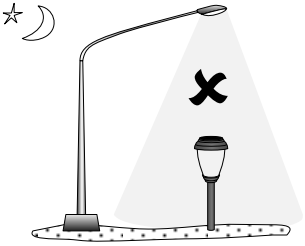


To assemble your Charleston Path Lights simply push the post and ground stake on as shown.

Position



Position the light to receive the maximum amount of sunlight. Do not position where the solar panel will be shaded.



Do not position under bright light as this will prevent the light switching on at night.

First Use

Although there may be some initial charge in the battery we recommend fully charging it before first use. Leave the switch (inside lens) in the off position for 2 sunny days to ensure the battery is fully charged. Once fully charged turn switch to on position. The light will now automatically illuminate when it gets dark. You can cover the light or place in a dark room to test that the light is operating.

Battery

Rechargeable batteries become less efficient with repeated charge-discharge cycles and the battery capacity reduces. If you find that the battery appears to be less efficient or does not run for long we suggest you first try to boost charge it. Switch off for 1 to 2 sunny days to allow the maximum charge to the battery. If after this boost charge your battery still does not perform to expectations you should replace it. All our batteries are covered by a 1 year warranty. To change the battery first remove the top by turning it and lifting off. Remove the 3 screws on the underside of the top to remove the battery cover. Remove the existing battery and replace with a new one. Only use Ni-MH or Ni-Cd rechargeable batteries. Please ensure that the battery is disposed of according to local regulations.
